## Monte Carlo Simulation For Project Schedule Probability Analysis Using Excel

<sup>1</sup>Akshay Bhaskar Bagal, <sup>2</sup>Dr. Sumant K Kulkarni <sup>1</sup>Student, <sup>2</sup>Professor D Y Patil Institute of Engineering & Technology, Ambi, Pune

*Abstract*— In this competitive world, with limited resources, cost and time in project management is paid increasing attention. For any kind of project, schedule is essential for successful execution of the project, so the management of schedule is very critical. It is observed that important risk about the construction schedule is time duration risk. Duration risk means the possibility and loss of incompletion of project in the stipulated duration limit. So it is necessary to analyze the Duration of project for which we can use Monte Carlo simulation. For entire project the probability of each work is determined using program evaluation and review technique [PERT] and normal distribution (using area under the curve). On the basis of probability obtained from PERT analysis (Normal or Beta distribution) it simulates the project's duration and analyses the probability of construction schedule by Monte Carlo simulation method. Monte Carlo simulation method is used to simulate the duration for each activity and also the overall project to accurately determine the project completion probability under considering of the changeability and randomness of duration for each activity.

#### Index Terms— PERT, Normal or Beta distribution, Monte Carlo Simulation.

#### I. INTRODUCTION (HEADING 1)

Construction projects are with many unique features such as long duration, complicated processes used for its execution, environment in which project has to be completed, financial intensity of the project and dynamic organization structures and such organizational and technological complexity generate various risks [8]. If it is observed schedules are essential to the successful execution of projects on time. However, schedule often contain significant uncertainty because risk and uncertainty are ingrained in all construction activities. It is widely accepted that construction project schedule plays major role in project management due to its influence on success of project within stipulated duration. The uncertainty and reliability related issues are becoming more critical in engineering design and analysis, proper assessment of the probabilistic behavior of an engineering system is important [16]. The true distribution for the system response is subject to parameter uncertainty that should be derived. However, due to the complexity of physical systems and mathematical functions, derivation of the exact solution for the probabilistic characteristics of the system response is somewhat difficult, but not impossible. In such cases, viable tool to provide numerical estimation of the stochastic features of the system response is Monte Carlo simulation (MCS). Monte Carlo simulation (MCS) is an influential technique [9]. Two important properties of Monte Carlo simulation are Simultaneous consideration of threats and opportunities, and probability of selecting various criteria. Monte Carlo simulation analysis is a statistical technique that could become as a means for risk assessors to evaluate the uncertainty. This availability has coincided with increasing dissatisfaction with the deterministic or point estimate calculations typically used in quantitative risk assessment; as a result, Monte Carlo simulation is rapidly gaining currency as the preferred method of generating probability distributions of risk.

#### **II. PROJECT SCHEDULE RISK ANALYSIS**

The purpose of analyzing risk is to help reduce the risk, and also to analyse what would happen in the future such that if any required decision are need be taken [1]. As risk and uncertainty are there in almost every project, therefore, project schedules often contain significant uncertainty in them, which makes scheduling even more difficult [8]. Also, since every project is unique and also conditions for every project are different so it becomes hard to accurately estimate the schedule at an early age. In such case, risk analysis and estimation of schedule are needed to be done efficiently and for this various techniques can be used [9]. To complete a project within a predefined schedule, it is essential to use proper planning tools and techniques. The two most widely used project planning & scheduling techniques PERT (Program Evaluation and Review Technique) & Monte Carlo simulation. [14].

Schedule risk analysis can help project managers identify and mitigate risks and achieve a better project outcomes. Ever since PERT was first put forward by Malcolm and successfully applied in Missile plan, PERT network is extensively used in the estimation of project duration and schedule uncertainty analysis for its simplicity [4]. However, PERT provide good approximation of risk when a project has only one path, it should not be used to analyze risk in schedules that have more than one parallel path because it underestimates the extra risk that occurs. Since almost all real projects have multiple paths, Monte Carlo simulation should be preferred analysis method. Also Monte Carlo simulation results is analyzed by thousands of simulated values.

#### III. PROJECT SCHEDULE RISK ANALYSIS IN EXCEL USING MONTE CARLO SIMULATION

There are various software used for Project schedule risk analysis with Monte Carlo simulation are Microsoft Project or Primavera, along with Monte Carlo simulation add-ins, such as @Risk or Risk+, also can be done in excel. As Excel is used to with everyone and also easy to use and understand so it would feasible to use excel in it. Entire project can be divided into

IJEDR1903041

activities. Here activities probabilities for various conditions are analysed using PERT and normal distribution. Further this data is collected together and used for analysing the project completion probabilities by using Monte Carlo simulation in Ms Excel.

#### **IV. CASE STUDY**

Consider P+2 building (from Ground work to second floor finishing) 4.1.1 Ground work consider following activities –

| Table 4.1.1.1 Ground work PI | ERT analysis |
|------------------------------|--------------|
|------------------------------|--------------|

| Substructure activities  | Events  | Time (Days) |    | ys) | Expected time (Te)      | Variance                   |  |  |  |  |
|--|---------|-------------|----|-----|-------------------------|----------------------------|--|--|--|--|
|  |         | To          | Tm | Тр  | Te=<br>(To+(4*Tm)+Tp)/6 | Variance=((Tp-<br>To)/6)^2 |  |  |  |  |
| Excavation   | 1 - 2   | 8           | 10 | 12  | 10.00                   | 0.4                        |  |  |  |  |
| Excavation with compaction   | 1 - 3   | 9           | 12 | 15  | 12.00                   | 1.0                        |  |  |  |  |

## **RESULTS AND ANALYSIS**

# By using Monte Carlo simulation above data is simulated 10000 times in excel and the following results are obtained

| Analysis                                |             |  |  |  |
|---|-------------|--|--|--|
| Expected duration                       | 281.7527091 |  |  |  |
| Mean of simulation values               | 229.895     |  |  |  |
| Standard deviation of simulation values | 2.808       |  |  |  |
| Minimum of simulation                   | 211         |  |  |  |
| Maximum of simulation                   | 238         |  |  |  |
| Х                                       | 232         |  |  |  |
| P(X<=225)                               | 0.938789822 |  |  |  |
|   |             |  |  |  |

| Project Start date  | 10-08-2018 |
|---|------------|
| Estimated project completion Date                             | 18-05-2019 |
| Estimated project completion Date as per Critical path method | 28-04-2019 |
| Average simulated date of project completion.                 | 27-03-2019 |

| Minimum simulated date of project completion. | 07-03-2019 |
|---|------------|
| Maximum simulated date of project completion. | 04-04-2019 |
| Most probable project completion date         | 31-03-2019 |

### CONCLUSION

From the above study it is concluded that there are various techniques for project schedule probability analysis but everyone has its own drawbacks. It is observed that Monte Carlo simulation technique is most feasible technique so its demand for estimating project schedule risk is increasing. It was found that data used for Monte Carlo simulation was taken from previous experience data but also we can estimate the each activities probability from PERT and normal distribution. Monte Carlo simulation can be easily implemented in Ms Excel. It uses 10000 times simulated data for analysis. In above case study we found that Monte Carlo simulation can be used to determine the probability of project completion date which is estimated at site. The expected date of project completion is 282 days but as per simulation results obtained 238 days is maximum simulated date of project completion. So it is found that we can complete project before the expected schedule date.

#### V. ACKNOWLEDGMENT

I am very thankful to my project guide Dr. S. K Kulkarni for the opportunity given to carry out the project titled "Project Schedule Probability Analysis Using Monte Carlo Simulation in Excel" His guidance throughout year has helped me to progress in the right direction. Also, I would like to express my gratitude to Dr. S K Kulkarni HOD-Civil and Dr. L. V. Kamble Principal, D Y Patil of Institute of engineering and Technology, Ambi & Dr. R. V. Kherde Principal, D Y Patil of school of engineering, Ambi. Also to those who have contributed directly and indirectly for the progress in Project Work. Finally, I would like to thank PG Coordinator (for Civil) – Himanshu Ahire for their guidance and support to complete Project.
